Jeremy Duncanson, director of the Australian Research Organisation – the body created by the Australian Council for Educational Research to undertake research – said:

"We need to focus on practices that deliver the most effective learning outcomes," Duncan said. "The evidence is overwhelming. The professor is extremely robust, up there with the most robust science based stuff there is. We know what works. We are talking here about explicit instruction, the teacher knowing what they're doing, knowing what the learning intentions are, knowing what success looks like and maintained. This approach is supported by cognitive science and our understanding of how the brain works.

Yet this is not the approach followed in most Australian classrooms. The problem is these practices are not widely understood by teachers. Duncanson said: "Teachers are not implementing what they know. Only 30 per cent of students in Australia are taught in ways that are evidence-based. We need to help teachers learn and picking up the most effective practices.

Mark Scott, secretary of the federal Department of Education and Training, said: "We know from surveys of teachers where they are but frankly that does not know how to teach reading or writing."

Today it remained – a belated minister should attempt to extend education before its entered politics His mission is to return. Australia by 2020 into the top group of education nations. He breaks as "shameful" The OECD's Programme for International Student Assessment (PISA) ranks countries in reading, maths and science.

Yesterday, Australia's performance in PISA tests in reading literacy, maths and science was released. The results showed Australia ranks in 2009 who started secondary school with best-minister-making Australia's ranking in reading literacy has fallen.

"Australia's performance in reading literacy has not declined, but significantly declined, and we should be "Today said. "When I point that out to my speeches people are shocked to find we have declined in our school "

Australia is free falling down the global table at an alarming rate of knots.

The knot (/nɒt/) is a unit of speed equal to one nautical mile per hour, exactly 1.852 km/h (approximately 1.151 mph or 0.514 m/s).

It is a worry when the experts use the word " kid" in lieu of "child", or "young person". Also, it is a worry when the experts refer to " maths" when the subject is "mathematics".
I understand now why our education standards are dropping when experts and educational leaders resort to this language flippancy.

Standardisation of the curriculum has resulted in lower standards. When it's compulsory for all schools to follow the same playbook which is designed with a low bar for "disadvantaged kids", it locks in the mediocrity. Experimental teaching methods, the low bar in teacher training and the persistent mediocrity in state schools exacerbates the problem.

Paul Kelly is obsessed about Trump and seems really frightened of rights if peopke from the Right but has a different views on BLM and Extinction Rebellion and by other fanatical Left groups!
His analysis here is good but his judgement is frequently limited and frightening when making erroneous judgements on what most Australiansvthink !

Sweller is right.
Inquiry based learning is what you take out in life AFTER being taught.

If your own teachers are too lazy to teach you then good luck passing it down.

As a teacher of 43 years, it is obvious to many of the experienced teachers that there is one outstanding reason for these poor results. Teacher training. Comparing my experiences at a teachers' college before it became a uni, and with the other educational institutions I've been observing for decades, it comes back to that - teacher training. And one significant aspect of that teacher training. The key words are literally, 'teacher training' NOT university lectures and tutorials! Yes, academic knowledge in specific classroom subjects is absolutely necessary, but not at the expense of teacher training. Back then, our experience was many more weeks spent in the classroom observing the best teachers and then teaching ourselves with the class teacher carrying us along, until we could actually teach practically. We had some theoretical input but it was almost all practical. Our debrief afterwards on site and back at college, along with lecturers of the key classroom subjects teaching like classroom teachers, was also a massive benefit. We experienced a number of different schools over our three years, seemingly significantly more than uni's today. When I left college, I could teach and teach well. My colleagues from that training system are/were very good teachers. Being trained gained a far better result!!!
Bring back those teachers' colleges or at least their training methodologies. Bring back real teachers who love this vocation/career. Not those brilliant academic sorts who never will be able to teach, or those looking for anything to do and falling into teaching. Teacher training the teachers' college ways.

This is because University Education courses also now lacks explicit knowledge based content. A case of the blind leading the blind.
